7 Capabilities You Must Look For In A Cloud Solution Provider

Choosing a Cloud Solution Provider (CSP) is easy if you know what to look for in an ideal solution provider. But, knowing what to look for can be a bit harder. Here is a handy checklist of capabilities that you must look for in a CSP to help you identify the right solution provider who can make your migration smooth, simple, and seamless.

1 Cloud Infrastructure

Infrastructure is the key reason to migrate workloads to the cloud or to set up new workloads in the cloud. Take it out and the reason vanishes. Hence, it's imperative that the CSP has a reliable, scalable, and highly available cloud infrastructure in place to suit all your current and future requirements.

Ether Cloud helps you bypass the cost and complexity of buying and managing physical servers and data centre infrastructure by allowing you to spin up and provision virtual or bare metal servers on demand in the cloud complete with compute, storage and networking resources with high availability, excellent reliability, and unlimited scalability and on a pay-as-you-go basis.

2 Choice of Clouds

Organisations need the freedom to choose from a variety of clouds to gain the flexibility to select the ideal cloud for any workload, easily switch or migrate workloads between clouds, and distribute a workload across two or more clouds, so that it can drive true transformation.

With Ether Cloud you can easily avoid vendor lock-in and spread your business-critical applications and services across multiple clouds by leveraging the flexibility to pick the cloud of your choice for each workload and switch or migrate workloads at will.

3 Advisory and Consulting

As organisations embark and progress on their cloud journey, they need a partner who can provide expert advice and guidance on the ideal cloud roadmap, the various deployment models, and the migration and management strategy to get optimum business value and desired results.

Now, define and develop a clear roadmap to the cloud to supercharge your migration and unlock business value with Ether Cloud. Proactively get expert guidance and advice—complete with best practices and technical expertise—that will help you make the right decisions to benefit your business.

4 Migration Tools

Migration to the cloud can be a complex and time-consuming exercise. But, by using specialised tools and technologies the migration timelines can be cut significantly, thus saving precious time and resources.
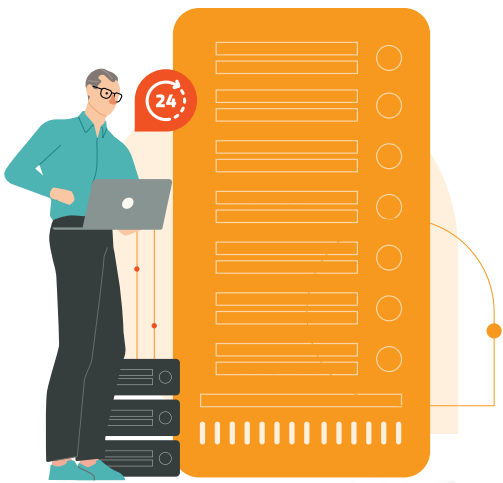

Ether Cloud helps you simplify and accelerate the migration of your infrastructure and workloads to the cloud with a comprehensive portfolio of automated tools to realise the business value quickly and comprehensively.

5 Ease of Management

Migrating workloads to the cloud is just the beginning. The continuous challenge is in the ongoing management and maintenance of the workloads, which can quickly become a time consuming, resource intensive, and tedious work for your internal IT staff.

Ether Cloud helps you free up the precious time of your internal IT resources from routine maintenance activities to focus on higher business critical and value-add work by taking over the headache of management and maintenance of infrastructure and applications.

6 Automation

Provisioning resources in the cloud and scaling them up and down to meet the fluctuating demands while continuing to maintain high availability and performance requires automation. Without automation, the true benefits of the cloud can never be achieved.
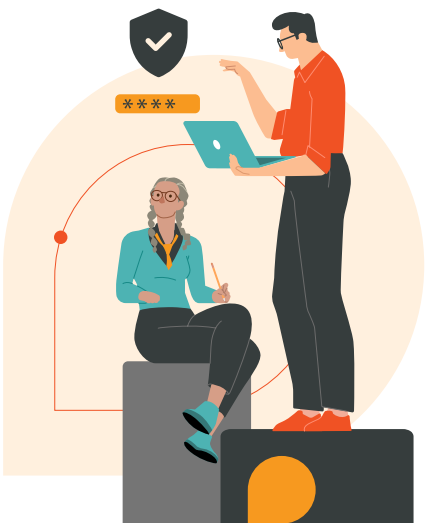

With Ether Cloud, automate the management and governance of your workloads and applications in the cloud with real-time autoscaling to enhance performance and user experience. Get a unified view of all your resources, applications, and services in a single control plane to improve visibility.

7 Compliance and Security

Compliance with government guidelines and data residency laws, meeting industry-specific regulations, and adhering to global security standards is a non-negotiable for any organisation as flouting or not meeting any of them can be very expensive and have serious consequences.

With Ether Cloud, easily meet and enhance compliance with government regulations on data residency and disaster recovery and with other industry-specific regulations and best practices. Enhance security of your applications and workloads with a cloud infrastructure that's certified to meet global and regional standards by leveraging best-in-class solutions.
